

Parnassus US ESG Growth Equities A USD

Morningstar Category* : US Large-Cap Growth Equity

Morningstar Sustainability Rating** :

Key information

▶ Net Asset Value	USD 122.489
▶ AUM	USD 6 million
▶ ISIN code	LU2796456932
▶ Total number of holdings	36
▶ SFDR classification	Art. 8 – ESG Investment Product

Fund profile

▶ ABN AMRO Investment Solutions has selected Parnassus Investments for managing an active US Large Cap Growth equity portfolio. ABN AMRO Investment Solutions has full daily transparency and risk control over the fund.

PARNASSUS INVESTMENTS®

▶ The sub-fund seeks to provide long term capital appreciation with a diversified and actively managed portfolio of US sustainable equities, without any specific restriction on tracking error.

The fund invests predominantly in transferable equity securities which are domiciled in or exercise the predominant part of their economic activity in the United States of America.

The fund is actively managed through a bottom-up/stock-picking, sustainable approach, designed to identify growth companies with paths to long-term secular growth, quality management teams and positive performance on ESG criteria.

The External Investment Manager emphasizes the future relevancy of products and services created by high-quality companies with durable competitive advantages, aiming at capturing more of the market upside than downside, with the selection of companies that are positioned for profitability over the long term.

The sub-fund's portfolio will be comprised of companies that meet the sustainability criteria put in place by the External Investment Manager and the Management Company.

Income is systematically reinvested.

Risk ratios

	Fund		Benchmark	
	1 year	3 years	1 year	3 years
Volatility	20.09%	-	22.32%	-
Tracking error	5.31%	-	-	-
Sharpe Ratio	0.52	-	0.55	-

Volatility is a statistical measure of the dispersion of returns for a portfolio or market index. In most cases, the higher the volatility, the riskier.

Tracking Error is the standard deviation of the difference between the portfolio return and the desired investment benchmark return.

Sharpe Ratio is a ratio used to measure risk-adjusted performance. It is calculated by subtracting the risk-free rate from the rate of return for a portfolio and dividing the result by the standard deviation of the portfolio returns.

Why is the Fund in this specific category?

Investments in equity include significant fluctuations in prices, due for instance to negative information about the issuer or market. Moreover, these fluctuations are often amplified in the short term.

The risk level of the Fund mainly reflects the market risks arising from investment in International Equities.

Other risks materially relevant to the Fund which are not adequately captured by the indicator are described below:

Small Cap, Specialised or Restricted Sectors Risk: Investing in small caps or specialised or restricted sectors is likely to be subject to a higher than average volatility. Smaller companies may find themselves unable to generate new funds to support their growth and development, they may lack vision in management, or they may develop products for new, uncertain markets.

Operational and Custody Risk: Some markets are less regulated than most of the international markets; hence, the services related to custody and liquidation for the Fund on such markets could be more risky.

Performances net of fees (in USD) ¹

*Past performance is not an indication of future performance. Performance is calculated net of fees except subscription fees. Performance may increase or decrease as a result of currency fluctuations and do not include taxes.

Quarterly comment

The ABN AMRO Parnassus U.S. ESG Growth Equities Fund outperformed the MSCI USA Growth Index during the fourth quarter. Sector allocation was the primary driver of outperformance, while stock selection also contributed. Within sector allocation, an overweight in Health Care buoyed relative performance the most, while an underweight to the Communication Services sector curbed relative results. Stock selection had a positive effect in Information Technology, Industrials and Health Care, but detracted in Communication Services and Consumer Discretionary. Within stock selection, the three greatest contributors were Natera, Applied Materials and Eli Lilly. The three largest detractors were Alphabet, AppFolio and DoorDash. During the quarter, we sold our position in Vertex Pharmaceuticals. The strategy exited the quarter most overweight in Health Care followed by Financials. The largest underweights were Information Technology and Consumer Discretionary. With continued risk of turbulence in the market, we have been tilting the portfolio toward a more defensive positioning while taking offensive positions in areas where our convictions are highest. Within our offensive positioning, we have taken advantage of market volatility to lean into secular trends through investing in AI beneficiaries including hyperscalers, semiconductors and attractive areas of software, as well as consumer internet and biotechnology. We believe growth equities to be an extraordinary asset class made up of companies that innovate, invest, adapt and deliver high returns on capital. Looking ahead to 2026, we temper our optimism with the reality that stocks don't rise forever at the fast rate we've seen in recent years. Investors should anticipate potential stock price corrections driven by short-term concerns over AI growth. The challenge—and opportunity—for investors is to separate the companies that are over-investing from those that will be able to compound value through multiple cycles. Throughout any volatility, we will continue to execute our investment process and seek opportunities to invest in increasingly relevant, competitively advantaged businesses at attractive valuations to deliver strong long-term returns.

Glossary

Alpha: Alpha measures the risk-adjusted performance of a portfolio. Negative alpha means that the fund has a negative risk-adjusted return. Positive alpha means that the fund has a positive risk-adjusted return.

Beta: Beta measures the elasticity of the valuation of an investment portfolio to changes in its reference market.

A $\beta < 1$ (> 1) is characteristic of a portfolio that mitigates (accentuates) changes in its benchmark. A $\beta = 1$ indicates perfect correlation, all other things being equal.

Sustainable/sustainability: Relating to environmental, social or governance aspects.

Duration: The duration of a bond or bond portfolio, expressed in number of years, corresponds to the discounted average life of all flows (interest and principal). All other things being equal, the higher the duration, the higher the risk. In order to know the level of risk of a bond portfolio, it is useful to know the duration of each of its bonds to determine the average duration of the portfolio.

Active Management: An investment management approach whereby a manager seeks to outperform the market based on research, analysis and its own opinion, for example.

Synthetic risk indicator (SRI): The SRI is an indicator with a score from 1 to 7 and which corresponds to increasing risk and reward levels. The SRI is used to assess the level of risk of this product compared to others. It indicates the likelihood that this product will incur losses in the event of market movements or if we are unable to pay you.

Investment grade: Investment grade securities are bonds issued by borrowers having a rating agency rating of AAA to BBB- on the Standard & Poor's scale. They are opposed to non-investment grade, or high yield securities (also called speculative grade), which are riskier but have a higher expected return (ratings ranging from BB+ to D according to Standard & Poor's). Investment grade bonds have a low level of risk compared with high yield bonds.

Spread: The risk premium, or spread, represents the difference in return between a bond and a risk-free loan of the same duration. It measures the difference between the rate of return on bonds issued by a company and the rate of return on bonds issued by creditworthy governments. It values the extra cost that investors require to take on the risk associated with the bond compared to a safe investment.

VaR: Value at Risk (VaR) represents an investor's maximum potential loss on the value of a portfolio of financial assets for a given holding period (e.g. 20 days) and confidence interval (e.g. 99%). This potential loss may be represented as a percentage of the portfolio's total assets.

Swing Pricing: Swing Pricing is the mechanism by which the Net Asset Value is adjusted upwards (or downwards) if the change in liabilities is positive (or negative) in order to reduce the portfolio adjustment cost associated with changes in liabilities for the fund's current unitholders.

Disclaimer

ABN AMRO Investment Solutions - AAIS

Limited company with Executive and Supervisory Board capital of 4,324,048 Euros registered with the RCS Paris under number 410 204 390, Head office: 119-121 Boulevard Haussmann, 75008 Paris, France, Approved by the AMF, dated 20/09/1999, as a portfolio management company under registration number GP99-27

This document is a promotional document (the "Document"), addressed to professional investors as defined in the MIFID Directive, and is intended only for investors whose share classes held are promoted and duly registered in their country of residence.
